# 01 Product Concept

## SendASnack Core

**SendASnack Core** is a deliveries platform that empowers traditional businesses to easily create deliveries for their products by using SendASnack's riders taskforce.

## SendASnack Store

**SendASnack Store** is a food store that sells Hamburgers and other consumables. It uses the SendASnack Core to make deliveries of their products.

# QA Strategy

# Static Code Analysis

The Static Code Analysis was performed using **Codacy**;

## Quality Gates

### Gates

Define the rules to enforce the quality of your commits and pull requests.

**Pull requests won't pass the quality gate when:**

New issues are over ☒ 0  issues of at least **medium**  severity

New security issues are over ☒ 1

Complexity is over ☒ 20

Duplication is over ☒ 5  cloned blocks

Diff coverage is under ☒ 70  %

Coverage variation is under ☐ -1  %

[Reset to default](#) ⓘ

# Management Tool

- To manage the sprints, user stories and tasks we've used **JIRA**.
- The tasks were written as User Stories, Tasks or Issues and were associated with a team member that would be responsible for implementing/fixing the user story or issue.

## Jira Workflow

# CI and CD

- Our project modules were deployed in Azure Cloud.
- The CI and CD pipeline was powered by **CircleCI**, and it allowed us to deploy new feature when they were either on *master* or *develop* branches.
- An example of a config.yml file that contains the CI and CD pipeline is available on: [https://github.com/SendASnack/core\\_backend/blob/main/.circleci/config.yml](https://github.com/SendASnack/core_backend/blob/main/.circleci/config.yml)
